

MODULE 1

# An agreed metrics scorecard for the programme

Leadership & the Investment Case

Workshop deliverable · template

# Purpose

The handful of metrics the programme is proven against. Baseline them now so the 8-week prove-it can report a credible before/after. Keep the set small and defensible — vanity metrics undermine the board case.

# The scorecard

| METRIC               | DEFINITION                         | BASELINE (TODAY) | TARGET | SOURCE             | CADENCE   |
|----------------------|------------------------------------|------------------|--------|--------------------|-----------|
| Cycle time           | First commit → merged to main      | —                | —      | Git / DORA         | Weekly    |
| Deployment frequency | Production deploys per period      | —                | —      | CI/CD              | Weekly    |
| PR throughput        | PRs merged per engineer per week   | —                | —      | Git                | Weekly    |
| Change-failure rate  | % deploys causing an incident      | —                | —      | Incidents          | Monthly   |
| Defect escape rate   | Bugs found in prod vs pre-prod     | —                | —      | Tracker            | Monthly   |
| Output per £         | Delivered scope ÷ engineering cost | —                | —      | Finance + delivery | Quarterly |

## The one that matters to the board

**Output per £ of engineering cost** is the primary KPI. It turns the productivity story into the language finance and PE already use.

# Notes

- Prefer trends over single readings — baseline over 2–4 weeks where possible.
- Note any metric that becomes meaningless post-AI (e.g. story-point velocity).
- Figures shown are directional, drawn from D55 delivery experience — confirm with the client's finance team. Pricing is provisional (see working-assumptions.md).
