

MODULE 2

A spec template written for human + AI consumption

The AI-First Delivery Lifecycle

Workshop deliverable · template

Why a spec template

When implementation goes 5x, clarity of intent becomes the multiplier. **Garbage specs at 5x speed = garbage 5x faster.** This template makes work startable by a human *and* consumable by an AI assistant — structured, unambiguous, contract-first.

The template

- › **Context** — the problem, who it's for, why now.
- › **Goal & non-goals** — what success is, and explicitly what's out of scope.
- › **Contracts / interfaces** — APIs, schemas, integration points, defined up front.
- › **Acceptance criteria** — testable statements the work must satisfy.
- › **Constraints** — security, performance, compliance, legacy touchpoints.
- › **Test notes** — what to generate tests for; edge cases to cover.
- › **Open questions** — decisions still needed, with owners.

The quality bar

If an AI assistant can't produce a reasonable first implementation from the spec alone, the spec isn't done. That's the signal, not a formatting rule.

Worked example (fill in with a real ticket)

- › Context: ____
- › Goal / non-goals: ____
- › Contracts: ____
- › Acceptance criteria: ____
- › Constraints: ____
