

MODULE 3

A test strategy for AI-generated code (gates, coverage, review bar)

Shipping Safely

Workshop deliverable · template

The principle

Confidence in AI-generated code should be **evidence-based, not assumed**. The bar is the same as human code; the tactics adapt to how AI produces code.

Gates & bar

CONTROL	STANDARD	YOUR SETTING
Coverage gate	CI fails below the agreed threshold, AI or human code	__%
Tests from specs	Tests generated against the spec's acceptance criteria	__
Human-in-the-loop	Mandatory human validation at integration points	__
Regression	Automated regression on key flows (e.g. Playwright)	__
Advanced	Mutation / property-based testing on critical paths	__
Prod feedback	Prod issues feed back into test coverage	__

New failure modes to watch

- › Plausible-but-wrong code that passes shallow tests.
- › Over-mocked tests that assert the implementation, not the behaviour.
- › Integration seems the assistant didn't have context for.
